List of plants

To catalogue the following list of plants and give all of their characteristics would involve an expense that would necessarily increase their price to three times the values quoted. All plants listed are strong growing plants as removed from their natural positions and are not seedlings.

Cacti do well in any good soil containing lime. A good compost consists of: 1-2 heavy soil, 3-8 sand, 1-8 lime stone rubble or hydrated lime, well rotted manure, leaf mold or peat. They should have perfect drainage. They should never be set in glazed or glass containers. They can be watered as often as a geranium if they have good drainage. All succulents can be cleared of pests, such as Mealy bug, Red spider, Scale and Aphis with the following solution: One or two ounces of denatured alcohol with as much fly spray (any good fly spray) as it will dissolve. Apply with sprayer. This solution will not injure your plants and will rid them of all pests as well as eggs.
